BRYANT GALLARDO

Tampa, FL | (813) 951-3593 | bgallardo88@gmail.com

TECHNICAL SKILLS

Frontend: TypeScript, JavaScript, React, Tailwind, CSS-in-JS, SCSS, Next.js (SSR), Webpack, Vite, React Native

Backend: Python, FastAPI, Flask, Django, Node.js, Java, C#, .NET Core, REST, GraphQL, Go

Databases: PostgreSQL, MySQL, MongoDB, DynamoDB, Redis

Cloud & Infrastructure: AWS (S3, Lambda, CloudFront, ECS/EC2, SQS/SNS, RDS)

Testing: Jest, Vitest, React Testing Library, Playwright, Cypress, Postman, pytest (unit, integration, E2E)

Tools & Practices: Git, CI/CD, Figma, Design Systems, Agile/Scrum

AI: AI-assisted development (Claude Code, Cursor, Copilot), LLM integration (OpenAI APIs)

PROFESSIONAL EXPERIENCE

Coinbase

Senior Software Engineer, Growth Foundations

2020 – 2026

- **Tech lead for Growth platforms** — owned horizontal platforms powering lifecycle communications, upsells, and marketing surfaces. Set technical strategy and led design and code reviews across the Growth org. Drove frontend architecture in React/TypeScript and co-designed REST/GraphQL API contracts and data models with backend teams, reviewing Go microservice implementations.
- **Growth Admin Platform** — drove architecture and technical roadmap for greenfield build of the unified platform where all growth, product, and marketing teams author, segment, test, launch, and analyze lifecycle communications, serving 150+ daily users and replacing a third-party CRM dependency (~$2M/yr savings). Architected React/TypeScript frontend and defined campaign data models and REST API contracts, enabling 1B+ messages/week across email, push, SMS, and in-app channels.
- **Upsell Platform** — authored end-to-end technical design (FE/BE) for a server-driven UI upsell platform, including eligibility rules to target upsells per user and frequency capping (budgets/cooldowns) to prevent fatigue. Defined SDUI schema for backend configuration and dynamic client rendering; built shared React/React Native library handling common upsell rendering, GraphQL data fetching, and view/click event tracking. Partnered with growth product teams on adoption, powering all Coinbase upsells while cutting implementation effort 99% and launch time from weeks to under a day.
- **Journey Builder** — built a drag-and-drop workflow editor (React Flow) for multi-step journeys with branching criteria, A/B testing, and analytics, backed by a Temporal-orchestrated workflow service. Designed normalized graph data models and memoized rendering to keep large canvases performant, and guarded complex editor interactions with extensive unit and integration test suites. Powered 100+ production journeys for onboarding and re-engagement, driving multi-million-dollar revenue uplift.
- **Marketing infrastructure** — scaled Next.js SSR marketing server to handle 10x traffic through 2021 bull run and 2022 Super Bowl ad campaign traffic spikes: defined SLOs, layered caching (Redis, Cloudflare CDN, in-memory LRU), rerouted marketing traffic off shared nginx proxy to isolate it from client-app traffic, migrated data layer to GraphQL, and led incident response. Also built marketing newsletter infrastructure reaching 20M+ customers with 40%+ open rates and 1M+ new subscribers.
- **Frontend architecture & DevEx** — re-architected Growth Admin from a legacy monorepo into a standalone modular monorepo, establishing an extensible foundation for teams to build and ship admin applications independently. Extracted shared libraries for UI components, auth, user context, data layer, routing, and test utilities; rebuilt CI/CD on GitHub Actions and added repo-level AI agent guidance (CLAUDE.md) for consistent AI-assisted development. Cut build times ~50% and deploy times ~63%, removing 10K+ lines of dead code.

ConnectWise

Senior Software Engineer, App Architecture *2014 – 2020*

- **Customer Portal** — architected and shipped a full-stack, multi-tier customer portal serving 100K+ end users: mobile-responsive React/Redux SPA, .NET Core REST API backend, MySQL database, and multi-region AWS deployment (S3, CloudFront, ECS/EC2).
- **React migration** — led migration of a 100+ page legacy web app to React, directing a team of contractors in building a new client architecture (Redux, ImmutableJS, TypeScript) and establishing reusable core modules across all application surfaces, retiring legacy GWT framework.
- **Design system** — designed and owned company-wide reusable component library and style guide with modular CSS and Jest/Enzyme test coverage; partnered with UI/UX to define and enforce consistent design standards across the product.

CAE USA, Inc

Software Engineer II *2011 – 2014*

- Developed the Instructor Operating Station for military flight simulation training systems using C#, WPF, and MVVM.

EDUCATION

B.S. Computer Engineering, Dual Major in Computer Science *2011*

University of South Florida

PROJECTS

Automelodia — Technical Co-Founder

- Sole backend engineer for an AI music generation platform: Python REST API + PostgreSQL backend; contributed full-stack to React/TypeScript/Tailwind frontend.
- Architected AWS infrastructure (SQS, EC2/GPU instances, S3) to self-host an open-source music generation model with async inference, from prompt intake to audio delivery.
- Integrated OpenAI API to process and enrich user prompts before generation.
- Took product from zero to a publicly launched, payment-ready (Stripe subscription billing) production app.

Self-Hosted Homelab & Home Automation

- Run 18+ VMs and LXC containers on Proxmox: media streaming, photo backup, NAS, Tailscale remote access.
- Built observability stack: Uptime Kuma heartbeat/health checks, SMART disk monitoring, Discord webhook alerting for service outages, drive health, and media server events.
- Built smart home automations & custom UI dashboards (Home Assistant).
- Built custom ESP32 microcontroller devices with ESPHome (Bluetooth proxy/NFC scanner).
- Use Claude Code as primary ops workflow: provisioning and configuring services, analyzing logs, and root-causing failures across stack and infrastructure.
