BRYANT GALLARDO

Tampa, FL | (813) 951-3593 | bgallardo88@gmail.com | https://bryant988.github.io

TECHNICAL SKILLS

Frontend: TypeScript, JavaScript, React, Tailwind, CSS-in-JS, SCSS, Next.js (SSR), Webpack, Vite, React Native

Backend: Python, FastAPI, Flask, Node.js, Java, C#, .NET Core, REST, GraphQL, Go

Databases: PostgreSQL, MySQL, MongoDB, DynamoDB, Redis

Cloud & Infrastructure: AWS (S3, Lambda, CloudFront, ECS/EC2, SQS/SNS, RDS)

Testing: Jest, Vitest, React Testing Library, Playwright, Cypress, Postman, pytest (unit, integration, E2E)

Tools & Practices: Git, CI/CD, Figma, Datadog, Design Systems, Agile/Scrum

AI: AI-assisted development (Claude Code, Cursor, Copilot), LLM integration (OpenAI APIs)

PROFESSIONAL EXPERIENCE

Coinbase

Senior Software Engineer, Growth Foundations

2023 – 2026

Platform engineering lead: led engineering for horizontal Growth platforms powering lifecycle communications and marketing surfaces, owning frontend and directing backend service design (REST/GraphQL API contracts and data models) with platform teams. Owned product strategy, technical direction, and architecture decisions. Partnered with product and design (Figma) from spec to launch.

- **Growth Admin Platform (Iris):** drove frontend architecture and roadmap for greenfield platform unifying Growth's targeting, content, experimentation, and approval services into single portal where growth, product, and marketing teams author, segment, test, launch, and analyze lifecycle communications. Serves 150+ daily users and replaced third-party CRM (~$2M/yr savings). Architected React/TypeScript frontend and defined campaign data models and REST API contracts, enabling 1B+ messages/week across email, push, SMS, in-app, upsells, and incentives/rewards.
- **Upsell Platform**: as tech lead, authored end-to-end technical design (FE/BE) for server-driven UI upsell platform, including per-user eligibility rules and frequency capping (budgets/cooldowns) to prevent fatigue. Defined SDUI schema for backend configuration and dynamic client rendering. Built shared React/React Native library for upsell rendering, GraphQL data fetching, and view/click tracking. Partnered with growth product teams on adoption, powering all Coinbase upsells while cutting implementation effort 99% and launch time from weeks to under a day.
- **Journey Builder**: built drag-and-drop workflow editor (React Flow) for multi-step journeys with branching criteria, A/B testing, and analytics, backed by Temporal-orchestrated workflow service. Designed normalized graph data models and memoized rendering to keep large canvases performant. Guarded complex editor interactions with extensive unit and integration test suites. Powered 100+ critical production journeys for onboarding and re-engagement, driving multi-million-dollar revenue uplift.
- **Architecture & DevEx**: re-architected Growth Admin from legacy monorepo into standalone modular monorepo, giving teams extensible foundation to build and ship admin applications independently. Extracted shared libraries for UI components, auth, user context, data layer, routing, and test utilities. Rebuilt CI/CD on GitHub Actions and added repo-level AI agent guidance (CLAUDE.md) for consistent AI-assisted development. Cut build times ~50% and deploy times ~63%, removing 10K+ lines of dead code.

Senior Software Engineer, Acquisitions

2020 – 2023

Marketing frontend lead: owned coinbase.com marketing surfaces (home, prices, Learn, product landing pages) serving 30M+ monthly visitors. Built on Next.js SSR and React/TypeScript, covering SEO, accessibility, localization, and experimentation. Led marketing frontend and Core Web Vitals working groups across org, and mentored engineers on fast-growing Growth frontend team.

- **CMS Platform & Coinbase Learn**: helped introduce headless CMS (Contentful) with block-based content models mapped to React components for marketing pages. Launched Coinbase Learn (hundreds of guides and tutorials) and consolidated ~40 product surfaces across 15 repos into single CMS-driven SSR app. Cut landing page creation from ~2 weeks to under a day and content changes from hour-long deploy cycle to under 10 minutes without engineering involvement, growing organic search traffic and signups.

- **Coinbase Bytes**: partnered with Marketing/CRM to build infrastructure for authoring and shipping weekly newsletter, plus dynamic CMS-driven archive site for every issue. Reached 20M+ customers with 40%+ open rates and drove 1M+ new subscribers.
- **Marketing infrastructure**: scaled Next.js SSR marketing server to handle 10x traffic through 2021 bull run and 2022 Super Bowl ad. Defined SLOs, layered caching (Redis, Cloudflare CDN, in-memory LRU) with CDN failover through CMS outages, and isolated marketing traffic from shared nginx proxy. Led SSR data-layer migration to GraphQL and served as incident commander, enhancing monitoring with Datadog.

ConnectWise

Senior Software Engineer, App Architecture *2014 – 2020*

- **Customer Portal:** architected and shipped a full-stack, multi-tier customer portal serving 100K+ end users: mobile-responsive React/Redux SPA, .NET Core REST API backend, MySQL database, and multi-region AWS deployment (S3, CloudFront, ECS/EC2).
- **React migration:** as tech lead, pioneered migration of a 100+ page legacy web app to React, directing a team of contractors in building a new client architecture (Redux, ImmutableJS, TypeScript) and establishing reusable core modules across all application surfaces, retiring legacy GWT framework.
- **Design system:** designed and owned company-wide reusable component library and style guide with modular CSS and Jest/Enzyme test coverage; partnered with UI/UX to define and enforce consistent design standards across the product.

CAE USA, Inc

Software Engineer II *2011 – 2014*

- Developed the Instructor Operating Station for military flight simulation training systems using C#, WPF, and MVVM.

EDUCATION

B.S. Computer Engineering, Dual Major in Computer Science *2011*

University of South Florida

PROJECTS

Automelodia — Technical Co-Founder *2023 – 2024*

- Sole backend engineer for an AI music generation platform: Python REST API + PostgreSQL backend; contributed full-stack to React/TypeScript/Tailwind frontend.
- Architected AWS infrastructure (SQS, EC2/GPU instances, S3) to self-host an open-source music generation model with async inference, from prompt intake to audio delivery.
- Integrated OpenAI API to process and enrich user prompts before generation.
- Took product from zero to a publicly launched, payment-ready (Stripe subscription billing) production app.

Self-Hosted Homelab & Home Automation *2024 – Present*

- Run 18+ VMs and LXC containers on Proxmox: media streaming, photo backup, NAS, Tailscale remote access.
- Built observability stack: Uptime Kuma heartbeat/health checks, SMART disk monitoring, Discord webhook alerting for service outages, drive health, and media server events.
- Built smart home automations & custom UI dashboards (Home Assistant).
- Built custom ESP32 microcontroller devices with ESPHome (Bluetooth proxy/NFC scanner).
- Use Claude Code as primary ops workflow: provisioning and configuring services, analyzing logs, and root-causing failures across stack and infrastructure.
